

DELEAFING MACHINES

Type UnoFlor, DuoFlor & OptiFlor

The Bercomex deleafing machines are available in various constructions for deleafing and possible dethorning of cut flowers. Bercomex offers a wide range of deleafing machines for light and heavy usage. All machines are carefully assembled, fit the European safety standards and are provided with the CE hallmark.

Usage

Retail Trade – Light Usage

The UnoFlor deleafing machine can operate on one side of the machine and can defoliate flowers quickly and accurately. The machine is provided with 4-comb rubber brushes and is suitable for roses and lilies among others.

The DuoFlor deleafing machine can be operated on two sides of the machine. This means that 2 persons can simultaneously process the same or different kind of flowers. Just like the UnoFlor, the DuoFlor is provided with 4-comb rubber brushes.

Floriculture and Flowertrade – Heavy Usage

The OptiFlor is a deleafing machine with an eminent construction, for professional deleafing of light and heavy products in larger quantities. The OptiFlor is provided with 8-comb rubber brushes on both sides. The brushes are easily interchangeable without use of any tools. The OptiFlor is standard equipped with a moveable undercarriage.

Accessories

Brushes

Bercomex offers a wide range of brushes for practically any application, adjusted to the different machine types. The choice of brushes is determined by the hardness of the stems of the product. The brushes are developed in different grades of hardness, to optimise the protection of the stems. The hardness of the brushes is recognizable by the colour of the brush. Soft brushes are green for instance.

Undercarriage

A separate undercarriage is available for the UnoFlor and the DuoFlor, with optional wheels so the machine is easily moveable.

Collecting bags and bins

The deleafing machines can be provided with synthetic collecting bags or bins for the leaves and/or thorns.
