

# Increase light levels and reduce disease problems by Getting rid of condensation

## ANTI CONDENS

During cooler months, condensation forms on the inside of greenhouses, particularly in plastic structures. This can result in 8% light loss and increase the risk of spreading diseases such as *Botrytis*.

AntiCondens is the solution. Once dry, it forms a coating that prevents the formation of droplets.

- Stops droplet formation—large droplets can result in 8% light loss.
- Increases light transmission into the greenhouse.
- Reduces disease problems such as *Botrytis*.
- Suitable for use on polycarbonate and inside plastic film greenhouses.
- Water-based and safe to use.
- Easily miscible in water.
- Once applied, AntiCondens will last for a whole season.
