

For effective monitoring and control of insects

Use Bug-Scan®

Insects can cause serious damage to your crop - sometimes before any obvious signs of the insect! This is why monitoring is so critical. Bug-Scan® provides simple, but very effective monitoring and/or trapping systems for all types of insects, including psyllid.

- Long-lasting glue on both sides
- Glue is non-toxic, water-repellent and doesn't dry out or drip in a hot climate
- available in yellow and blue (the blue colour is highly attractive to thrips and much less attractive to beneficial bugs).

Bug-Scan® exists in two formats:

- **Bug-Scan®**, a large card that includes a grid on one side of the sticky trap to facilitate counting.
- **Bug-Scan® Roll**, a roll of plastic tape covered on both sides with the same non-toxic glue as Bug-Scan®. The sticky rolls have a 2 cm border without glue and a non-sticky part at the beginning of the roll to facilitate handling.

Talk to your local representative for more information on Bug-Scan® and insect control options.
